

The making of a decorative granite spiral with a polished rose quartz ball which stands on a hollow stone and concrete paver.

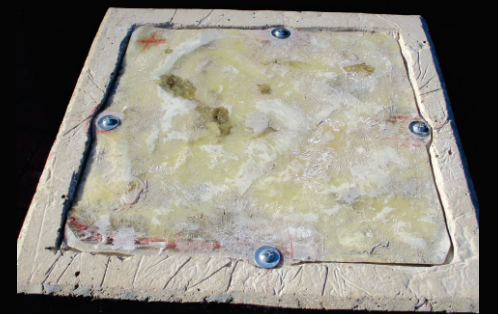

This decorative spiral was created using an oblong piece of natural granite- left -with the rough markings made using masking tape. We cut in between using an angle grinder below right before polishing smooth below left

The making of the base. We made it hollow as our idea down the line is to grow a plant from the top and wrap the roots around the spiral and let it enter the sand inside the paver for nutrients and water

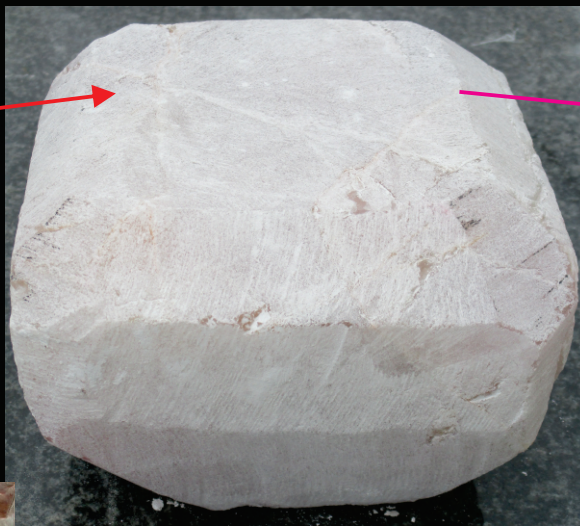

Rock slices were cut using an angle grinder (above left), then embedded into cement (over middle) then ground smooth and polished (above right)

Above left-the polished base with a pin for the spiral pillar to sit on. A round hold was also cut into the paver for the roots once established around the spiral to enter and grown into the soil housed within the paver.

In order to screw the fiberglass lid into the concrete we made some holes using a dremel and a diamond bit and then glued inserts/helicoils into the recesses. Alternatively the lid can be siliconed into place

In order to create this rose quartz ball we started with a natural chunk top left which we cut into the desired shape -top middle before polishing smooth top /middle right.
